

Usage Prorated to Calendar Month

Avista bill dates rarely correspond to the beginning and end dates of each calendar month. However, Energy Star Portfolio Manager Software performs calculations based on energy usage data per calendar month. In order to accommodate this, Avista prorates energy usage data to coincide with the calendar month.

Example:

Avista Bill Period: May 15th to June 15th, the average daily usage was 52 kWhs.
June 16th to July 15th, the average daily usage was 47 kWhs.

Prorated Bill Period: June 1st to June 15th, 15 days times 52 kWhs per day = 780 kWhs
June 16th to June 30th, 15 days times 47 kWhs per day = 705 kWhs
Total Prorated Usage for the month of June: 780+705 =1485 kWhs

Gas usage is similarly calculated with therm daily averages.
