

## Greenhouse Gas Emissions

The procedure that Avista uses to estimate its greenhouse gas emissions is consistent with recognized methodologies (*e.g.*, the WRI/WBCSD Greenhouse Gas Protocol). The emissions estimates below reflect Avista's ownership share of emitting assets. They include only direct emissions. Avista's greenhouse gas inventory has not undergone a third party audit or verification as of December 2006. Below is a table showing Avista's annual CO<sub>2</sub> emissions from 1999 – 2005.

Year	Total Emissions		Emission Intensity <sup>3</sup>	
	CO <sub>2</sub> (lbs) <sup>1</sup>	CO <sub>2</sub> (million tons) <sup>2</sup>	CO <sub>2</sub> (lb/MWh Avista)	CO <sub>2</sub> (lb/MWh US National Average)
1999	6,545,821,017	3.27	857	1400
2000	5,106,767,539	2.55	738	1370
2001	4,916,671,019	2.46	884	1400
2002	3,067,306,101	1.53	536	1400
2003	3,829,812,748	1.91	611	1320
2004	3,880,529,941	1.94	603	
2005	5,172,030,103	2.59	705	
2006	4,719,963,521	2.36	624	

Notes:

1-CO<sub>2</sub> (lbs) = lbs CO<sub>2</sub> from direct (Scope 1) fossil fuel stationary combustion

2-CO<sub>2</sub> (million tons) = short tons CO<sub>2</sub> from direct (Scope 1) fossil fuel stationary combustion / MWh generated from all energy sources

3-lbs CO<sub>2</sub> from direct (Scope 1) fossil fuel stationary combustion / MWh generated from all energy sources
